Industry: [Energy](#), [Education](#)

June 10, 2013, 6:12 am -- [/EPR NETWORK/](#) -- Renewable energy - if you haven't noticed, it's the buzz around the world. We are using an alarming amount of fossil fuels every day; fossil fuels that won't last forever. Some experts say we will be known as the generation that destroys the earth unless we change our energy behavior now.

"Renewable Energy makes sense from both a financial and a green responsibility" says Todd Sachs, co-founder and Chief Marketing Officer of www.renewablehomeenergy.org.

"We are committed in educating consumers on how to turn their homes into Renewable Energy Homes. We help by connecting consumers with qualified installers throughout the United States so they can save money on their fast rising energy bills, create more value in their home investment, and join together in reducing dependency on fossil fuels; together reducing the carbon footprint." Sachs says.

A recent press release from the whitehouse.gov states the following:

"President Obama is committed to an "all-of-the-above" approach that develops all American energy sources in a safe

and responsible way and builds a clean and secure energy future. That's why the President's plan:

Challenges Americans to double renewable electricity generation again by 2020. In order to double generation from wind, solar, and geothermal sources by 2020, relative to 2012 levels, the President called on Congress to make the renewable energy Production Tax Credit permanent and refundable, which will provide incentive and certainty for investments in new clean energy. Instead of continuing century-old subsidies to oil companies, the President believes that we need to invest in the energy of the future. During the President's first term, clean energy tax incentives attracted billions of dollars in private investment in almost 50,000 clean energy projects, creating tens of thousands of jobs. Permanent extension keeps the momentum building, while creating new jobs in clean energy."

Once Americans realize just how possible it is to remove their home from the grid completely and/or partially, many will turn to clean energy sources such as wind, solar and geothermal for home energy systems. Renewable Home Energy (www.renewablehomeenergy.org) just launched last week and is serving-up a great way to connect homeowners with qualified renewable energy installers throughout the entire United States.

Renewable Home Energy is committed to working with local governments, manufactures and installers to help develop affordable ways for consumers to save money with Renewable Energy to remove them from the grid and reduce the carbon footprint by reducing the usage of the finite fossil fuels.

The process is easy. Just click on www.renewablehomeenergy.org and learn about Renewable Energy for your home. You can also complete a form to connect with a Renewable Energy Installer. You will be contacted by qualified installers in your immediate area. They will review your current energy consumption and suggest the best Renewable Energy alternatives for your home.

There are great tax incentives for you to install renewable energy in your home, and great finance options with 4% or less interest rates for up to 10 year terms for qualified buyers.
