

Email Archiving System Designer Highlights FSA Mobile Recording Solutions

Released on: September 21, 2011, 5:00 pm

Author: Robin Bingeman

Industry: [Software](#)

LONDON, UK - Every business from international banks to single trading desks are working on finding a solution that will comply with the new FSA mobile communications recording mandate.

The new regulations will require all companies that participate in the country's capital markets to record the mobile communications of all their employees who are involved in trading. This regulation includes voice calls, SMS and Instant Messages.

"In the marketplace, variations in cost, capability and deployability exist," said Robin Bingeman of Cryoserver, an [email archiving system](#) specializing in [email storage](#) and [email servers](#). "Companies should evaluate suppliers carefully to ensure the technology they implement is compliant and user-friendly."

SIM-based

Older solutions that complied with the 2008 FSA landline recording mandate required huge upfront costs and high per call charges. With the SIM-based solution companies simply replace the SIM in their phones and transfer their contacts - that's it, for one price.

Calls do not lag in connection time and there is no obtrusive third-party listening in. All inbound and outbound calls are recorded over the wireless network and archives in real-time. Like an [email archiving solution](#), the SIM allows users to access archived recordings quickly.

Software-based

A [Software](#) application is placed on each mobile device and then routed to an existing server used for landline calls. Or, another option is to deliver the

solution as a service, whereby a third party is "conferenced" into the call for recording.

Both options in this solution rely on the mobile client to be constantly updated. As the updates on the operating systems progress, users may be required to update or change their mobile client.

While it is important for businesses understand the drawbacks of each solution, it is more important that they be prepared to show how the service is tamper proof. With CryoSIM, from the developers of Cryoserver, there is a tamper resistant assurance, adds Bingeman.
