December 12, 2012, 12:21 pm -- /[EPR NETWORK](#)/ -- Lamp Post Electrical now stock the excellent Came range of electric gate opening systems, which have made such an impression on the market place. These units are of excellent quality and allow the house entry gates to be used instead of being an ever open adornment to the property. Lamp Post Electrical is particularly pleased to be able to supply the Came Frog AE-P24 Kit which offers the complete underground fitting kit for a pair of swing gates. This particular unit offers the ability to open a pair of gates up to 3.5 metre wide for each leaf using a 24v DC motor. The easy opening and closing of gates ensures maximum usage and they will always be kept closed which gives security within the property and privacy as the front garden can in many cases now become an area which can be used without being overlooked.

Lamp Post Electrical are delighted with the operational system of the [Came electric gates](#) and the silent running of the gates when opening and closing them is such that there is no possible annoyance to the family or neighbours. The Came Frog AE-P24 Kit is an underground kit which means that the swinging operating units are fitted into the ground at the outside end of each gate and the gate is mounted on top of the unit. The advantage of this is that the unit is particularly neat and tidy in its appearance or perhaps that should be non-appearance as all the operating mechanism is below ground and a flat top plate to the unit is all that is visible to the outside world. This

installation provides the basis for a good reliable set up which will last for years.

Gate operation takes about 16 seconds so that it is slow enough for pedestrians to get out of the way although there is obvious safety cut outs if there is a problem and also release mechanisms if required. The typical opening is 90 degrees but this can be extended to 130 degrees with a suitable adaption of electronics and mechanism. The system is a robust one and the gate mechanisms can support gates up to a weight of 400kg for each leaf of the gate, which allows the installation of some very substantial gates.

Lamp Post Electrical - <http://www.lamppostelectrical.co.uk> - have worked hard to get the range right and Came are an excellent company who provide a good quality product which has been greatly enhanced by the Frog electronic control systems. The advantages of the operation of the Came Frog system of underground fitted gates is that they can be used from a distance to open and close them at will with the [Came gate remote](#), which is ideal for the car driver arriving or leaving the premises.

It also allows the home owner to let in visitors from inside the house either by car with a double gate opening or by pedestrian access with a single gate opening. Lamp Post Electrical is proud to be able to stock such an excellent range of products, which will enhance any property to which they are installed.
