Industry: [Transportation / Logistics](#)

UK, July 25, 2012, 4:04 pm -- [/EPR NETWORK/](#) -- Worldwide Parcel Services is proud to have developed a system with its main delivery route suppliers within the United Kingdom whereby a parcel can be tracked throughout its journey so that at the click of a button the position of the parcel can be established and the user can estimate the arrival time of the goods concerned. Tracking a parcel can be of no use at all to many customers but to some customers it is vitally important to its continued operation.

Worldwide Parcel Services has embraced the delivery system whereby the "Just in Time" work procedures of modern industry require goods delivered just before they are required to be used in the production cycle. "Just in time" systems have been adopted in industry so that the storage requirements of goods delivered into the production line are kept small and close to the works operation. This also means that the customer requires far less in the way of cash flow to manage his business. The only way a business like this survives is if the [international parcel delivery](#) systems the company uses can meet the requirements necessary for a good production operation and they can absolutely rely on his courier to deliver on time.

Another important delivery system requires spare parts for emergency breakdowns to be tracked so that everything is ready for their immediate usage on arrival at their end point.

The third tracking requirement is the important document or file transfer business which requires legal or financial documents to be transferred in bulk exactly when required and at great speed.

In these cases [Worldwide Parcel Service tracking](#) systems come into their own, as a parcel is tracked throughout its journey. On entry into the Worldwide Parcel Service system the parcel is labelled with a bar code system that is unique to the parcel itself. Its position is logged onto the computer system and at this stage the parcel becomes live as far as Worldwide Parcel Service and its couriers are concerned although the results are not usually posted on line within the first 24 hours. Every time the parcel is shipped the delivery movement is registered into the computer by scanning the bar code. This scanning can be instantly sent to the computer library and the customer can access it position and find out just where it is and estimate when it will arrive.

Worldwide Parcels Services is working hard to get this system to a fool proof stage so that the customer is getting more and more information. The whole tracking system is important to the carrier and to the user alike, the carrier needs to know where parcel is at any time so that he can check if the deliveries are on time and that there have been no unexpected delays. This way Worldwide Parcel Service will be able to take action if the problem affects the user. Worldwide Parcel Service can also check on the delivery team at any time and see if there are any weak links.
